Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 3, 8 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 3 recites the limitation "said second and third elongated sides" in line 2. Claim 8 recites the limitation "said second fabric layer" in line 1. There is insufficient antecedent basis for these limitations in the claims.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Lewit et al (US 5,664,518). Figure 4 of Lewit shows a composite part having an integrated flow channel, comprising an elongated foam core 21; a flow channel medium attached to the elongated foam core and extending along a first elongated side thereof, the flow channel medium defining interstices 19 for the passage of resin; at least one fabric layer 13 secured to the elongated foam core, and enclosing

the elongated of the foam core, including the flow channel medium 15. Figure 4 further shows the fabric layer 13 encloses at least a second and third elongated side of the foam core, each of said second and third elongated sides adjoining the first elongated side. Figure 4 also shows the composite part comprising fabric tab portions extending from the second and third elongated side.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 9 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lewit et al (US 5,664,518) as applied to claim 1 above, further in view of Young et al (US 3,703,739). Lewit teaches the flow channel medium formed from a non-woven fabric. Lewit is silent as to the three dimensional web of the flow channel medium. Young teaches a non-woven web formed from a three dimensional matrix of nylon fibers (column 1, lines 28-31). It would have been obvious to one having ordinary skill in the art at the time the invention was made to employ the three dimensional plastic matrix as the flow channel medium motivated by the desire to facilitate the flow of the resin.

With regard to claim 9, since Lewit as modified by Young is using the same material to form the flow channel medium of the composite part, i.e., three

dimensional non-woven fibers, it is the examiner's position that the porosity would be inherently present within the range set forth in the claims.

Allowable Subject Matter

8. Claim 7 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. None of the prior art discloses or suggests the composite part according to claim 1 wherein the flow channel media is bounded by a second fabric layer interposed between the foam core and the flow channel media.
